2. Erik Assadourian, "The Rise and Fall of Consumer Cultures," in *State of the World 2010*, ed. Worldwatch Institute (New York: W. W. Norton, 2010), 15.

3. How many pounds of grain and soy are consumed by one American steer to get one pound of edible meat? (a) The total forage (hay, silage, grass) consumed is 12,000 pounds (10,000 pre-feedlot and 2,000 in feedlot), and the total grain and soy-type concentrate consumed is about 2,850 pounds (300 pounds grain and 50 pounds soy before feedlot, plus 2,200 pounds grain and 300 pounds soy in feedlot). Therefore, the actual percentage of total feed units from grain and soy is about 25 percent. (b) But experts estimate that the grain and soy contribute more to weight gain (therefore to ultimate meat produced) than their actual proportion in the diet. They estimate that grain and soy contribute about 40 percent of weight put on over the life of the steer. (c) To estimate what percentage of edible meat is due to the grain and soy consumed, multiply that 40 percent (weight gain due to corn and soy) times the edible meat produced at slaughter, 432 pounds: $0.4 \times 432 = 172.8$ pounds of edible portion contributed by grain and soy. (Those who state a 7:1 ratio use the entire 432 pounds edible meat in their computation.) (d) To determine how many pounds of grain and soy it takes to get this 172.8 pounds of edible meat, divide total grain and soy consumed, 2,850 pounds, by 172.8 pounds of edible meat: $2,850 \div 172.8 = 16$ to 17 pounds. (I have taken the lower figure, since the amount of grain and soy being fed may be going down a small amount.) These estimates are based on several consultations with the United States Department of Agriculture (USDA) Economic Research Service and the USDA Agricultural Research Service, Northeastern Division, plus newspaper reports of actual grain and soy being fed to cattle.

See also “Concerning 400Wealthiest: The Forbes 400 Special Report,” *Forbes*, September 17, 2008, www.forbes.com/2008/09/16/forbes-400-billionaires-lists-400list08_cx_mn_0917richamericans_land.html. This article estimates that the four hundred wealthiest people in America have a combined net worth of \$1.57 trillion. See also James Davies et al., “The Global Distribution of Household Wealth,” *WIDER Angle* (Canada) 2 (December 1, 2006): 4–7. Global household wealth (defined as the value of physical and financial assets minus debts) in 2000 was valued at \$125 trillion, and the poorest 50 percent of the world’s adults owned barely 1 percent of global wealth, which would equal \$1.25 trillion.

27. Robert B. Reich, *Supercapitalism: The Transformation of Business, Democracy, and Everyday Life* (New York: Knopf, 2007), 113. The family of Walmart founder Sam Walton has a combined fortune estimated to be about \$90 billion. The combined wealth of the bottom 40 percent of the US population, comprising some 120 million people, in the same year, 2005, was estimated to be around \$95 billion.

28. For total emissions, see Nicholas Stern, “Action and Ambition for a Global Deal in Copenhagen,” United Nations Environment Program, December 6, 2009, www.unep.org/pdf/climatechange/actionandambitionforglobaldealincopenhagen.pdf. The 47 billion metric tons is an estimate for 2010 and is in the higher range of expert estimates. The 25 billion metric tons is derived from taking the more conservative estimate and applying to the current period the historical average percentage of greenhouse gases absorbed. Absorption calculated from R. A. Houghton, “Balancing the Global Carbon Budget,” *Annual Review of Earth and Planetary Sciences* 35(2007): 313–347.

29. This is calculated using data from William F. Ruddiman, “The Anthropogenic Greenhouse Era Began Thousands of Years Ago,” *Climatic Change* 61, no. 3 (2003): 261–293; Thomas Boden, Gregg Marland, and Robert Andres, “Global, Regional and National Fossil-Fuel CO Emissions,” Carbon Dioxide Information Analysis Center, 2 http://cdiac.ornl.gov/trends/emis/tre_glob.html (accessed February 21, 2011).

30. This is calculated using data from Boden, Marland, and Andres, “Global, Regional and National Fossil-Fuel CO Emissions”; Richard Houghton, “Carbon Flux to the Atmosphere from Land-Use Changes: 1850–2005,” in *TRENDS: A Compendium of Data on Global Change* (Oak Ridge, TN: Carbon Dioxide Information Analysis Center, 2008), <http://cdiac.ornl.gov/trends/landuse/houghton/houghton.html> (accessed February 21, 2011).
